---

To the Project Manager

Regarding the above subject, whilst this strategy has been informative in it's context it does not really allow for individual feedback only comments and the ability to agree / disagree with the statements made in the strategy.

As I am currently working within the water industry, in particular with bore water supply pumps for the mining, industrial and agricultural sectors, I am fully aware of the current and more importantly future water crisis. The continued unchecked and unregulated use of our **non-renewable** groundwater supplies must be tackled as one of the states' most important water initiatives, as continued over use of this precious resource will take it past the point of no return.

The use of re-cycled waste and storm-water, desalination plants and projects such as the Wellington Dam project must be fully examined and then actually implemented.

This issue must not be used as a political football any longer, we must have some decisive action taken and more money allocated in state budgets to secure the future of the state for the generations to come.

I would be willing to participate further in this strategy.

Regards
